

1/2 inch CCD Image Sensor for NTSC Color Camera

Description

ICX026CKA is an interline transfer CCD solid-state image sensor suitable for NTSC 1/2 inch color video cameras. High sensitivity is achieved through the adoption of Ye, Cy, Mg and G complementary color mosaic filters and HAD (Hole-Accumulation Diode) sensors.

Beside correspondence with timing generator CXD1253, 5V drive of the reset gate is also possible.

This chip features a field integration read out system, an electronic shutter with variable charge-storage time and 20pin Cer-DIP package.

Features

- High sensitivity (+6 dB compare with ICX026AK)
- Optical size 1/2 inch format
- Field integration read out system
- Low dark current. High sensitivity HAD sensor
- Ye, Cy, Mg, G on chip type complementary color mosaic filter.
- Horizontal register 5V drive
- Reset gate 5V drive
- High antiblooming
- Low smear
- Variable speed electronic shutter

Device Structure

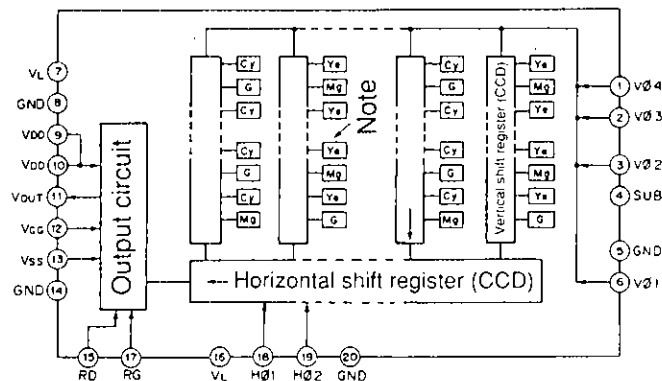

- Number of effective pixels 510 (H) × 492 (V)
- Number of total pixels 537 (H) × 505 (V)
- Interline transfer CCD image sensor
- Chip size 7.84 mm (H) × 6.40 mm (V)
- Unit cell size 12.7 μm (H) × 9.8 μm (V)
- Optical black
 - Horizontal (H) direction Front 2 pixels Rear 25 pixels
 - Vertical (V) direction Front 12 pixels Rear 1 pixel
- Number of dummy bits
 - Horizontal 16
 - Vertical 1 (even field only)
- Substrate material silicon

Package Outline

Unit: mm

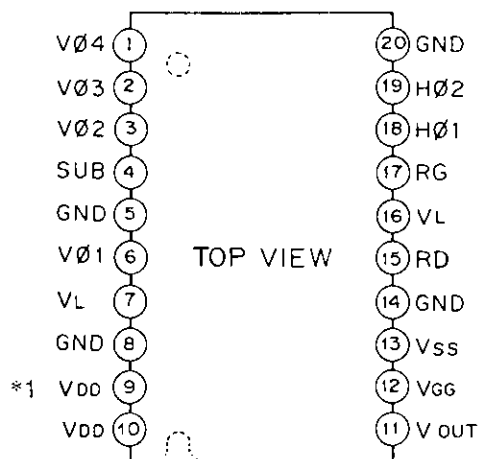

Block Diagram

Note) □ : Photo sensor

Pin Configuration (Top View)

*1 As Pins 9 and 10 are internally shorted, if either one is connected to the power supply while the other may be kept open. Should both be connected to the power supply, make sure the same voltage is applied.

Pin Description

No.	Symbol	Description	No.	Symbol	Description
1	Vφ4	Vertical register transfer clock	11	VOUT	Signal output
2	Vφ3	Vertical register transfer clock	12	VGG	Output amplifier gate bias
3	Vφ2	Vertical register transfer clock	13	VSS	Output amplifier source
4	SUB	Substrate (Overflow drain)	14	GND	GND
5	GND	GND	15	RD	Reset drain bias
6	Vφ1	Vertical register transfer clock	16	VL	Protective transistor bias
7	VL	Protective transistor bias	17	RG	Reset gate clock
8	GND	GND	18	Hφ1	Horizontal register transfer clock
9	VDD	Output amplifier drain supply	19	Hφ2	Horizontal register transfer clock
10	VDD	Output amplifier drain supply	20	GND	GND

Absolute Maximum Ratings

- Substrate voltage SUB – GND -0.3 to +55 V
- Supply voltage VDD, RD, VOUT, VSS, – GND -0.3 to +18 V
VDD, RD, VOUT, VSS, – SUB -55 to +10 V
- Clock input voltage Vφ1, Vφ2, Vφ3, Vφ4, Hφ1, Hφ2 – GND -15 to +20 V
Vφ1, Vφ2, Vφ3, Vφ4, Hφ1, Hφ2 – SUB -65 to +10 V
- Voltage difference between vertical clock input pins +15 V *2
- Voltage difference between horizontal clock input pins +17 V
- Hφ1, Hφ2, – Vφ4 -17 to +17 V
- RG, VGG – GND -10 to +15 V
- RG, VGG – SUB -55 to +10 V
- VL – SUB -65 to +0.3 V
- Beside GND, SUB, VL – VL -0.3 to +30 V
- Storage temperature -30 to +80 °C
- Operating temperature -10 to +60 °C

*2 +27 V (Max.) when clock width < 10 μs, duty factor < 0.1%.

Clock Voltage Conditions

Item	Symbol	Min.	Typ.	Max.	Unit	Waveform	Remarks
Read out clock voltage	V _{V1}	14.3	15.0	15.7	V	1

Vertical transfer clock equivalent circuit

Horizontal transfer clock equivalent circuit

Drive Clock Waveform Conditions

1. Read out clock waveform

2. Vertical transfer clock waveform

3. Horizontal transfer clock waveform

4. Reset gate clock waveform

VRGLH is the maximum value and VRGLL the minimum value of the coupling waveform of the period from Point A, in the diagram above, up to RG rise. VRGL is the mean value for VRGLH and VRGLL.

$$VRGL = (VRGLH + VRGLL)/2$$

VRGH is the minimum value for twh period.

$$VφRG = VRGH - VRGL$$

5. Substrate clock waveform

Item	Symbol	twh			twl			tr			tf			Unit	Remarks	
		Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.			
Read out clock	V _T	1.5	1.85							0.5			0.5	μs	During read out	
Vertical transfer clock	V _{φ1} , V _{φ2} , V _{φ3} , V _{φ4}									0.45	0.015		0.25	μs	*1	
Horizontal transfer clock	H _φ	34	39		38	40			14	17		8	12	15	ns	During imaging *2
Horizontal transfer clock	H _{φ1}		5.6						0.014				0.012		μs	During parallel serial conversion.
Horizontal transfer clock	H _{φ2}					5.6			0.014				0.012		μs	During parallel serial conversion.
Reset gate clock	φ _{RG}	14	15		75	79			6.5				4.5		ns	
Substrate clock	φ _{SUB}	1.5	2.1						0.5				0.5		μs	During charge drain.

*1) When vertical transfer clock driver CXD1250 is in use. tr and tf are defined as the rising and falling time of 10% to 90% the period between V_L and V_H.

*2) Where, tr-tf is < 4ns, the waveform crosspoint voltage (Vcr) of H_{φ1} and H_{φ2}, is taken as 2.3V < Vcr < 2.7V.

Operating Characteristics

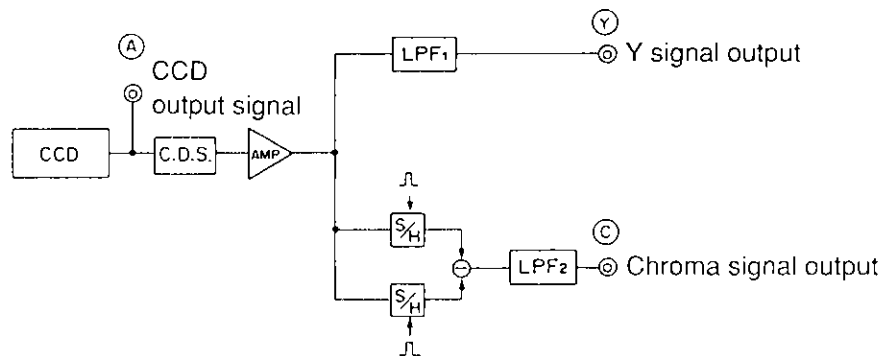

Ta = 25°C

Item	Symbol	Min.	Typ.	Max.	Unit	Test method	Remarks
Sensitivity	S	260	340		mV	1	
Saturation signal	Ysat	500			mV	2	Ta=60°C
Smear	SM		0.005	0.015	%	3	
Blooming margin		1000			times	4	
Video signal shading	SHy			20	%	5	Zone0, I
				25	%	5	Zone0, I to II, II'
Uniformity between signal channels	ΔSr			10	%	6	
	ΔSb			10	%	6

Zone chart of Video signal shading

Testing System

Note) Adjust AMP amplifier so that total gains between A and Y and between A and C equal 1.

Test Method

Test conditions

- 1) Through the following tests the substrate voltage should set to the value displayed on the device, while the device drive conditions should be kept within the range of the bias and clock voltage conditions.
- 2) Through the following tests defects are excluded, and unless otherwise specified the optical black level (Hence forth referred to as OPB) is set as the reference for the signal output which is taken as the Y signal output or the Chroma signal output of the testing system.

Color coding of CFA (Color Filter Array) & Composition of luminance (Y) and chrominance (C) signals.

CFA of this image sensor is shown in the Figure. This complementary CFA is used with a "field integration mode", where all of the photosites are read out during each video field. Signals from two vertically adjacent photosites, such as line A1 or A2 for field A, are summed when the image charge is transferred into the vertical storage columns. The readout line pairing is shifted down one line for field B. The sensor output signals through the horizontal shift register (H reg.) at line A1 are

Color Coding Diagram

[G+Cy], [Mg+Ye], [G+Cy], [Mg+Ye].

These signals are processed in order to compose Y and C signals. By adding the two adjacent signals at line A1, Y signal is formed as follows:

$$Y = \{(G+Cy) + (Mg+Ye)\} \times 1/2$$

$$= 1/2 \{2B+3G+2R\}$$

C signal is composed by subtracting the two adjacent signals at line A1.

$$R - Y = \{(Mg+Ye) - (G+Cy)\}$$

$$= \{2R-G\}$$

Next, the signals through H reg. at line A2 are

[Mg+Cy], [G+Ye], [Mg+Cy], [G+Ye]

Similarly, Y and C signals are composed at line A2.

$$Y = \{(G+Ye) + (Mg+Cy)\} \times 1/2$$

$$= 1/2 \{2B+3G+2R\}$$

$$-(B-Y) = \{(G+Ye) - (Mg+Cy)\}$$

$$= -\{2B-G\}$$

Accordingly, Y signal is balanced in relation to the scanning lines, and C signal takes the form of R-Y and -(B-Y) on alternate lines.

It is the same for B field.

Definition of standard imaging conditions

① Standard imaging condition I: (As imaging device) Use a pattern box (luminance 706 cd/m² 3200K Halogen source), at F5.6 with a typical test lens, and CM-500S (t=1.0 mm) for IR cut filter.

② Standard imaging condition II: Use a light source with uniformity within 2%, color temperature of 3200K and CM-500S (t=1.0 mm) as IR cut filter. The light intensity is adjusted in accordance with the average value of Y signals (Y_A) indicated in each item.

- 1) Set to standard imaging condition I and measure Y signal (S) at the center of the screen.
- 2) Set to imaging condition II. Adjust light intensity to 10 times when Y signal output average value Y_A=150mV. Then test Y signal Min. value.
- 3) Set to imaging condition II. Adjust light intensity to 500 times when Y signal output average value Y_A=150mV. Stop Read out clock. When the charge drain executed by the electronic shutter at the respective H blankings takes place, test the Max. value Y_{SM} of Y signal output.

$$SM = (Y_{SM}/Y_A) \times 1/500 \times 1/10 \times 100 (\%) \quad (1/10V)$$

- 4) Set to imaging condition II. Adjust light intensity to 1000 times when Y signal output average value Y_A=150mV. Then check that there is no blooming.
- 5) Video signal shading SH_y
Set to standard imaging condition II. Test Y signal Max. (Y max.) and Min. (Y min.) values. Adjust light intensity to obtain a Y signal output average value (Y_A) of about 150mV.

$$SH_y = (Y_{max} - Y_{min})/Y_A \times 100 (\%)$$

- 6) Set to standard imaging condition II. Adjust light intensity to obtain a Y signal output average value (Y_A) of 150mV. Test the Max. (Cr max. and Cb max.) and Min. (Cr min. and Cb min.) values of C signals from R-Y and B-Y channels.

$$\Delta Sr = | (Cr \text{ max.} - Cr \text{ min.}) / Y_A | \times 100 (\%)$$

$$\Delta Sb = | (Cb \text{ max.} - Cb \text{ min.}) / Y_A | \times 100 (\%)$$

- 7) Test the average Y signal voltage when the device ambient temperature is at 60°C and light is obstructed with horizontal idle transfer level as reference.
- 8) Following 7, test Max. (Y_d max.) and Min. (Y_d min.) values of Y signal output. Only keep spot defects out of this range.

$$\Delta Y_{dt} = Y_{d \text{ max}} - Y_{d \text{ min}}$$

9) ① F_y

Set to standard imaging condition II. Adjust light intensity to obtain a Y signal output average value (Y_A) of 150 mV. Test the Y signal difference (ΔY_f) between even field and odd field.

$$F_y = (\Delta Y_f / Y_A) \times 100 (\%)$$

② F_{cr} , F_{cb}

Set to standard imaging condition II. Insert R and B filter respectively, and test the C signal difference (ΔC_r , ΔC_b) between even field and odd field and the C signal output average value (C_{Ar} , C_{Ab}). At that time, adjust light intensity to obtain a Y signal output average value (Y_A) of 100 mV.

$$F_{ci} = (\Delta C_i / C_{Ai}) \times 100 (\%) \quad (i = r, b)$$

10) Set to standard imaging condition II. Insert W, R, G and B filters respectively, and test the signal difference (ΔY_{lw} , ΔY_{lr} , ΔY_{lg} , ΔY_{lb}) between Y signal lines of the same field. At that time, adjust light intensity to obtain a Y signal output average value (Y_A) of 100 mV.

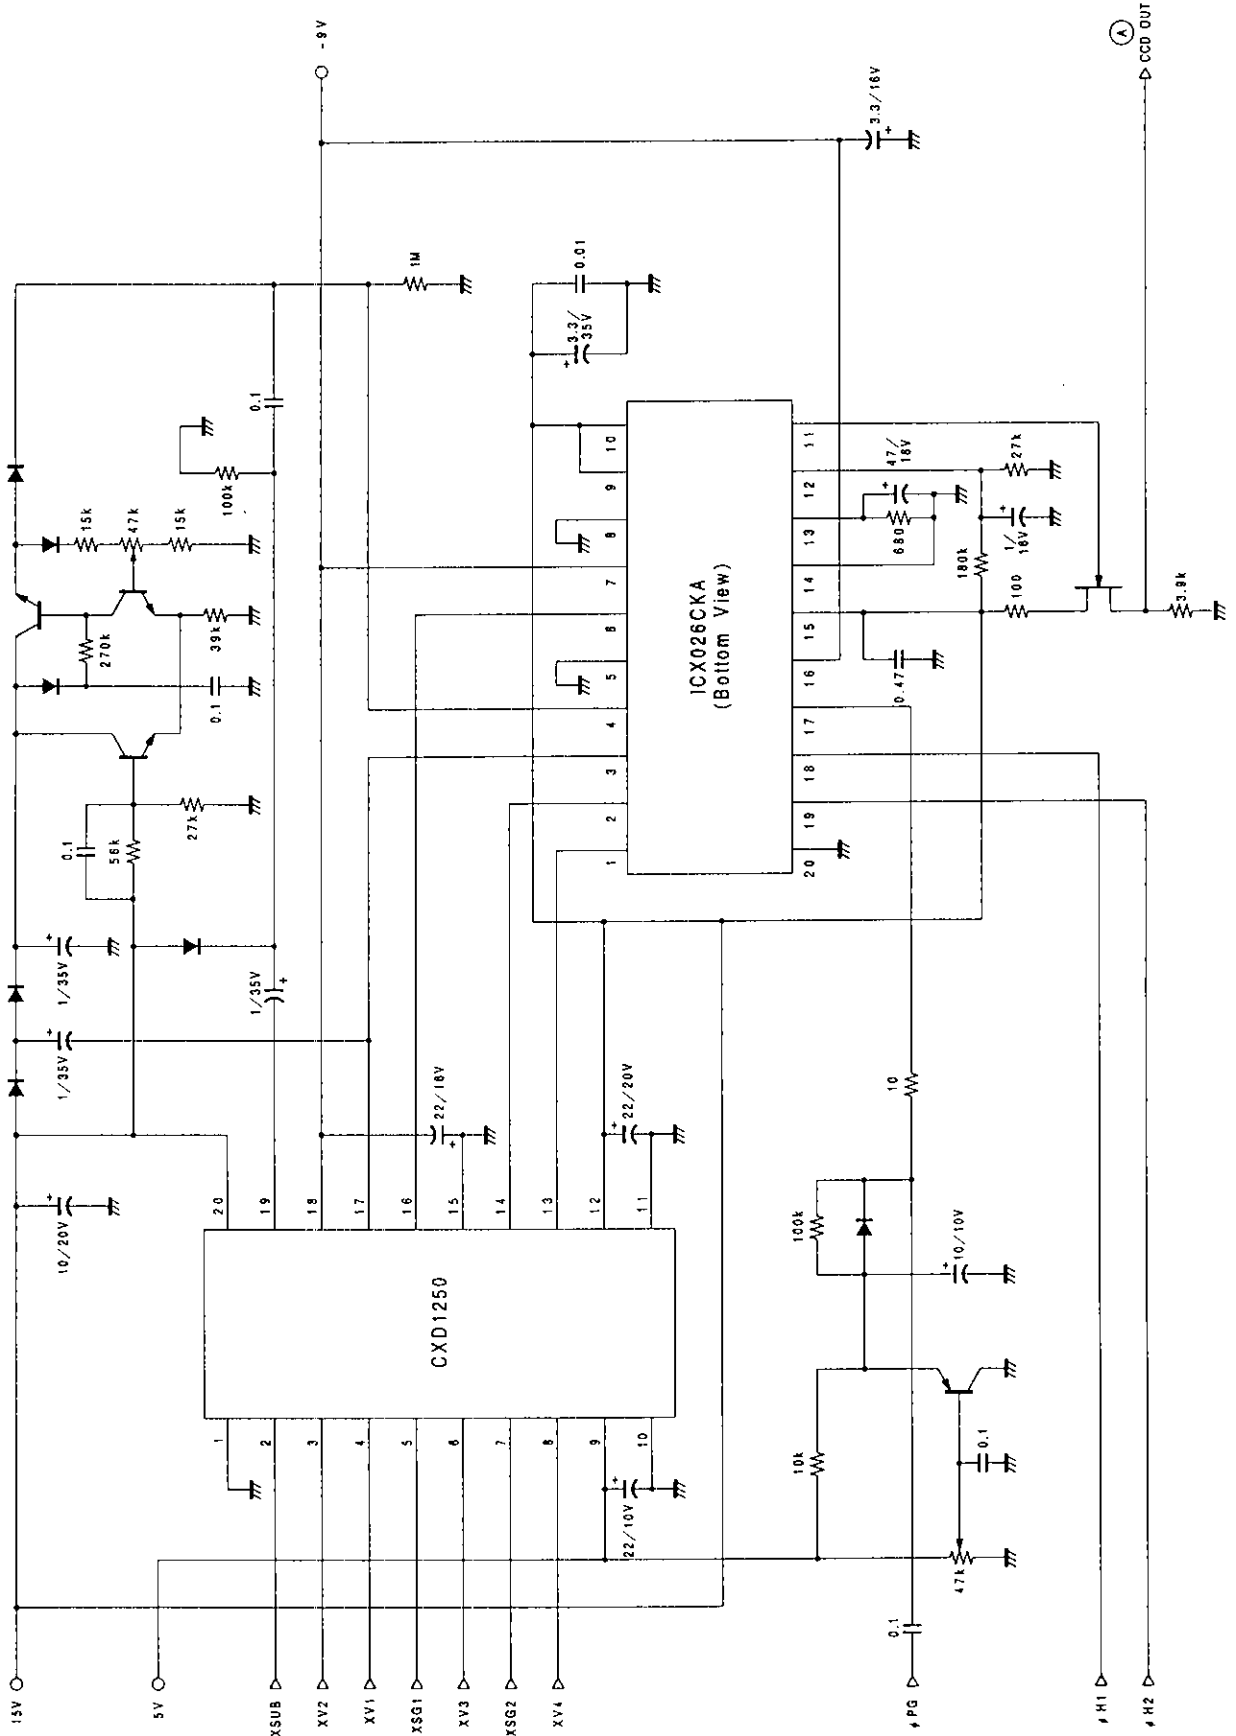

$$L_{ci} = (\Delta Y_{li} / Y_A) \times 100 (\%) \quad (i = w, r, g, b)$$

11) Light a stroboscopic tube with the following timing and test the lag.

$$\Delta Y_{lag} = (Y_{lag} / Y_s) \times 100 (\%)$$

Handling Instructions

- 1) Static charge prevention
CCD image sensor are easily damaged by static discharge. Before handling be sure to take the following protective measures.
 - a) Either handle bare handed or use non chargeable gloves, clothes or material. Also use conductive shoes.
 - b) When handling directly use an earth band.
 - c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
 - d) Ionized air is recommended for discharge when handling CCD image sensor.
 - e) For the shipment of mounted substrates use boxes treated for the prevention of static charges.
- 2) Soldering
 - a) Make sure the package temperature does not exceed 80°C.
 - b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a grounded 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount cool sufficiently.
 - c) To dismount an imaging device do not use a solder pult. When using an electric desoldering tool use a thermal controller of the zero cross On/Off type and connect to ground.
- 3) Dust and dirt protection
 - a) Operate in clean environments (around class 1000 will be appropriate).
 - b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface blow it off with an air blow. (For dirt stuck through static electricity ionized air is recommended)
 - c) Clean with a cotton bud and ethyl alcohol if the glass surface is grease stained. Be careful not to scratch the glass.
 - d) Keep in case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
 - e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.
- 4) Do not expose to strong light (sun rays) for long periods, color filters are discolored.
- 5) Exposure to high temperatures or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.
- 6) CCD image sensor are precise optical equipment that should not be subject to mechanical shocks.
